Submodules

functest.core.cloudify module

functest.core.singlevm module

Ease deploying a single VM reachable via ssh

It offers a simple way to create all tenant network resources + a VM for advanced testcases (e.g. deploying an orchestrator).

```
class functest.core.singlevm.SingleVm1 (**kwargs)
    Bases: functest.core.singlevm.VmReady1
```

Deploy a single VM reachable via ssh (scenario1)

It inherits from TenantNetwork1 which creates all network resources and completes it by booting a VM attached to that network.

It ensures that all testcases inheriting from SingleVm1 could work without specific configurations (or at least read the same config data).

```
check_console_loop = 6
```

```
check_console_regex = ' login: '
```

```
clean ()
```

Clean the resources.

It can be overridden if resources must be deleted after running the test case.

connect (*vm1*)

Connect to a virtual machine via ssh

It first adds a floating ip to the virtual machine and then establishes the ssh connection.

Returns: - (fip, ssh) - None on error

create_floating_ip_timeout = 120

execute ()

Say hello world via ssh

It can be overridden to execute any command.

Returns: echo exit codes

prepare ()

Create the security group and the keypair

It can be overridden to set other rules according to the services running in the VM

Raises: Exception on error

It ensures that all testcases inheriting from SingleVm1 could work without specific configurations (or at least read the same config data).

boot_vm (*name=None, **kwargs*)

Returns: True or False on errors

clean ()

Clean the resources.

It can be overridden if resources must be deleted after running the test case.

clean_orphan_security_groups ()

functest.core.tenantnetwork module

Ease deploying tenant networks

It offers a simple way to create all tenant network resources required by a testcase (including all Functest ones):

- TenantNetwork1 selects the user and the project set as env vars

- TenantNetwork2 creates a user and project to isolate the same resources

This classes could be reused by more complexed scenarios (Single VM)

```
class functest.core.tenantnetwork.TenantNetwork1 (**kwargs)
```

Bases: xtesting.core.testcase.TestCase

Create a tenant network (scenario1)

It creates and configures all tenant network resources required by advanced testcases (subnet, network and router).

It allows running TestCase and getting its execution status.

The subclasses must override the default implementation which is false on purpose.

The new implementation must set the following attributes to push the results to DB:

- result,
- start_time,

- stop_time.

Args: kwargs: Arbitrary keyword arguments.

Returns a list of `munch.Munch` containing the services description

Raises `OpenStackCloudException` if something goes wrong during the openstack API call.

`functest.utils.functest_utils.search_services (cloud, name_or_id=None, filters=None)`

Search Keystone services via `$OS_INTERFACE`.

It mainly conforms with [Shade](#) but allows testing vs public endpoints. It's worth mentioning that it doesn't support keystone v2.

Parameters

- **name_or_id** – Name or id of the desired service.
- **filters** – a dict containing additional filters to use. e.g. `{'type': 'network'}`.

Returns a list of `munch.Munch` containing the services description

Raises `OpenStackCloudException` if something goes wrong during the openstack API call.
